

FOOT Installation Instructions

FOOT is the new Docker report generator created by OOPSIE interns! It's awesome! Here's how you can use FOOT.

1. Checkout the FOOT repository

```
git clone git@gitlab.oops.invalid:foot.git
```

2. Run this command line

```
cd foot && make && make test && sudo make install
```

3. Profit!

```
$ foot /path/to/your/docker/image /path/to/reports/file
```

Runs FOOT on the provided image and generates a report.

If you run into any issues, reach out to Samir.

=====

Note: I had trouble getting this to work unless it was run as root. Something about Docker and my user not being in the right groups? Hmm. Should probably clean this up at some point to clarify if anything else needs to happen first.

=====

Note 2: The OOPSIE intern from last summer said this actually might not play nicely with images generated through some Docker commands. He wasn't sure which ones. I guess beware of that?
